

2022 United Nations Ocean Conference Side Event

Biorock® Technology for Climate Proofing Beaches, Regenerating Marine Ecosystems, and Sustainable Mariculture

01.07.2022, 15:00 GMT+1, Lisbon, Portugal

Organized by: Blue Regeneration S.L.

Blue Regeneration S.L. has raised awareness on one of the most important crises faced by humanity today: climate change. Climate change means the beaches are eroding, entire ecosystems are collapsing, species are dying and entire communities are forced to migrate. Biorock technology reverses the consequences of climate change. Blue Regeneration aims to finalize agreements to execute large-scale projects, and get funding for further R&D and pilot projects for new applications of the technology.

There are three important applications of Biorock Technology. Beach restoration and shore protection, marine ecosystem regeneration and sustainable mariculture. Extensive research and development, as well as pilot projects have proven the efficiency of Biorock against all other traditional methods of beach protection and marine ecosystem regeneration. Previous and planned projects were discussed, in hopes that through raising awareness, more interest and thus funding could be obtained.
