Safe water for fight against malnutrition and for cognitive development of school-age children in rural areas of Sub-Saharan Africa

Access to drinking water for children of school age remains a major problem in rural areas of Sub-Saharan Africa. Nowadays, no child should have suffer from a lack of safe water. Access to drinking water is one of the major solutions in the process of fight against malnutrition. Good health and good nutrition contribute to the cognitive development of school-aged children. The lack of water causes the lack of hygiene and sanitation, children cannot wash their hands properly before eating. This leads to various diseases and severe malnutrition.

If we would like to fight against malnutrition and to contribute to the cognitive development of school-age children in rural area in sub-Saharan Africa, we must implement the policies of " All children need safe water every were, every day and every moment" in each country.

It is crucial to promote water drilling in schools in rural areas of Sub-Saharan Africa. All stakeholders should be involved to increase safe water funding for school-age children in rural areas of Sub-Saharan Africa. The private and public sector, and Other stakeholders must support and assist the women organizations’s commitment and action on promoting safe water of school-age children in rural areas of Sub-Saharan Africa. Because women know more about their children's needs.
