Water Protection Bill-2022

Today's need for Water Protection...

Earth's life is entirely based on the water, environment and ocean, in the entire universe; Earth is the only life-giving planet that has the full support of nature. Life on earth is not possible without water and the environment, so we must all resolve to protect the water together and it is necessary and extremely important to live a happy and healthy life.

If we think about it today, we have done a lot of damage and polluted the water. Many river side areas, lakes, ponds, forests have been degraded by human beings for their own selfishness and greed for material comforts. There are many natural resources on this earth that human beings have damaged these water resources for their own selfish ends. Many places highlands, river areas are covered by cement buildings and uses of plastic and e-waste products. In the River side many trees have been cut down and so many natural disasters have befallen humans. Peoples are responsible for all this issues.

Everyone should be satisfied with the environment and nature. Today is the age of technology but no one is trying to protect the nature from pollution, with this so called new technologies. In my opinion everyone should strive protect their surroundings from being polluted, plant trees for oxygen in the surrounding environment to minimize air pollution. Water should be used suitably. Rain water should be stored in rivers, lakes dams and canals. The soil should be protected from being unproductive and polluted. There's no need to tell how important this earth is to us and we also know that how we humans completely depend on water and other environment resources .We led to the destruction of nature and kept polluting our environment. Before it's too late we should protect our environment, water and preserve it for future generations.

A statement for the United Nation:

1) First of all, the Governments should set up a national level committee for water protection and appoint national level organizations / associations / individual / local representatives those who are working on water pollution issues in this committee.

2) The Government should not allow new constructions in all the near natural, hilly areas, riverside areas, lakes in the present condition of the whole of world. All these natural areas should be called green water zones.

3) In every scenic and rivers, lakes areas and places in the every country should be referred to as green water zones. Even in this area, new constructions should not be allowed or constructions should be allowed considering the rules of environmental and water protection.

4) Efforts need to be made to plant trees, save river, save lakes, save natural water resources in every places of the country and to create awareness among the children at the school level about environmental and water protection and its importance.

5) Most of the traditional festivals and celebrations in all over the world are in concord with nature. Today's generation needs to understand advantages and disadvantages.

6) **"Let's go towards the Nature 2022"** This mission can create awareness about environmental issues and water protection by connecting every citizen.

7) To start this mission from individual, schools, colleges, It will connect every district and city with nature.

8) Water protection bill research should be carried out for recycling of plastic waste and e-waste by various projects and ideas.

9) The concept of save water, pure drinking water for all and save trees should be implemented in different ways at the district level. Training, conferences, webinar, Lectures and competitions should be held on the importance of water and how it can be reused.

10) To prepare and follow the state level regulations for the protection and safety of rivers, lakes and river side areas in each country.

Everyone must follow all the rules as above. The United Nation **Water Protection Bill-2022** is important for environmental and ocean protection by introducing this bill.

Thanks & Regards
